

Finite Sets and Frege Structures¹

John L. Bell

Call a family \mathcal{F} of subsets of a set E *inductive* if $\emptyset \in \mathcal{F}$ and \mathcal{F} is *closed under unions with disjoint singletons*, that is, if $\forall X \in \mathcal{F} \forall x \in E - X (X \cup \{x\} \in \mathcal{F})$. A *Frege structure* is a pair (E, ν) with ν a map to E whose domain $\text{dom}(\nu)$ is an inductive family of subsets of E such that $\forall X, Y \in \text{dom}(\nu) (\nu(X) = \nu(Y) \Leftrightarrow X \approx Y)$.² In [1] it is shown in a constructive setting that each Frege structure determines a subset which is the domain of a model of Peano's axioms. In this note we establish, within the same constructive setting, three facts. First, we show that the least inductive family of subsets of a set E is precisely the family of *decidable Kuratowski finite* subsets of E . Secondly, we establish that the procedure presented in [1] can be reversed, that is, any set containing the domain of a model of Peano's axioms determines a map which turns the set into a *minimal* Frege structure: here by a minimal Frege structure is meant one in which $\text{dom}(\nu)$ is the least inductive family of subsets of E . And finally, we show that the procedures leading from minimal Frege structures to models of Peano's axioms and vice-versa are *mutually inverse*. It follows that the postulation of a (minimal) Frege structure is constructively equivalent to the postulation of a model of Peano's axioms.

All arguments will be formulated within constructive (intuitionistic) set theory³.

1. Some definitions of finiteness. Fix a set E . By "set" "family", "singleton", etc. we shall mean "subset of E ", "family of subsets of E ", "singleton of E ", etc. For a set X define

$\mathbf{K}(X) \Leftrightarrow X$ is in every family containing \emptyset , all singletons, and closed under unions of pairs of its members. If $\mathbf{K}(X)$, we shall say that X is *Kuratowski finite*.

$\mathbf{L}(X) \Leftrightarrow X$ is in every family containing \emptyset and closed under unions with singletons. If $\mathbf{L}(X)$, we shall say that X is *finite*.

$\mathbf{M}(X) \Leftrightarrow X$ is in every inductive family. If $\mathbf{M}(X)$, we shall say that X is *strictly finite*.

$\mathbf{D}(X) \Leftrightarrow$ for every $x, y \in X$, either $x = y$ or $x \neq y$. If $\mathbf{D}(X)$, X is said to be *decidable*.

¹ *Journal of Symbolic Logic* 64, no. 4, 1999.

² We write $X \approx Y$ for *there exists a bijection between X and Y* .

³ This set theory may be taken to be intuitionistic Zermelo set theory or the local set theory presented in [2].

1.1. *Lemma.* $\forall X[\mathbf{M}(X) \Rightarrow \mathbf{L}(X)]$.

Proof. Obvious.

1.2. *Lemma.* $\forall X[\mathbf{K}(X) \Leftrightarrow \mathbf{L}(X)]$.

Proof. Clearly $\mathbf{L}(X) \Rightarrow \mathbf{K}(X)$. To prove the converse, it suffices to show that the family $\mathcal{L} = \{X: \mathbf{L}(X)\}$ is closed under unions of pairs. To this end let $\Phi(U)$ be the property $\forall X \in \mathcal{L} U \cup X \in \mathcal{L}$. It suffices to show $\forall U[\mathbf{L}(U) \Rightarrow \Phi(U)]$. Clearly $\Phi(\emptyset)$. Assuming $\Phi(U)$ and $X \in \mathcal{L}$ we have $U \cup X \in \mathcal{L}$ and so $U \cup X \cup \{x\} \in \mathcal{L}$ for arbitrary x , whence $\Phi(U \cup \{x\})$. Hence $\forall U[\mathbf{L}(U) \Rightarrow \Phi(U)]$ and the result follows.

1.3. *Lemma.* $\forall X[\mathbf{M}(X) \Rightarrow \mathbf{D}(X)]$.

Proof. Obviously $\mathbf{D}(\emptyset)$. If $\mathbf{D}(X)$ and $x \notin X$, clearly $\mathbf{D}(X \cup \{x\})$. The result follows.

1.4. *Lemma.* $\forall X[\mathbf{M}(X) \Rightarrow \forall a[\mathbf{D}(X \cup \{a\}) \Rightarrow (a \in X \text{ or } a \notin X)]]$.

Proof. Write $\Phi(X)$ for the condition following the first implication. Clearly $\Phi(\emptyset)$. Suppose that $\Phi(X)$ and $x \notin X$. If $\mathbf{D}(X \cup \{x\} \cup \{a\})$, then $\mathbf{D}(X \cup \{a\})$, so, since $\Phi(X)$, either $a \in X$ or $a \notin X$. Since $\mathbf{D}(X \cup \{x\} \cup \{a\})$, it follows that $a = x$ or $a \neq x$. Hence

$$(a \in X \ \& \ a = x) \text{ or } (a \notin X \ \& \ a = x) \text{ or } (a \in X \ \& \ a \neq x) \text{ or } (a \notin X \ \& \ a \neq x),$$

The first three disjuncts each imply $a \in X \cup \{x\}$, and the last disjunct means $a \notin X \cup \{x\}$.

Accordingly $a \in X \cup \{x\}$ or $a \notin X \cup \{x\}$. We conclude that $\Phi(X \cup \{x\})$ and the result follows.

1.5. *Lemma.* $\forall X[\mathbf{L}(X) \ \& \ \mathbf{D}(X) \Rightarrow \mathbf{M}(X)]$.

Proof. We need to show $\forall X[\mathbf{L}(X) \Rightarrow \Phi(X)]$, where $\Phi(X)$ is $\mathbf{D}(X) \Rightarrow \mathbf{M}(X)$. Clearly $\Phi(\emptyset)$. Assume $\Phi(X)$ and $\mathbf{D}(X \cup \{a\})$. Then $\mathbf{D}(X)$, so, since $\Phi(X)$, it follows that $\mathbf{M}(X)$. Since $\mathbf{D}(X \cup \{a\})$, 1.4 gives $a \in X$ or $a \notin X$. In either case we deduce that $\mathbf{M}(X \cup \{a\})$. Hence $\Phi(X \cup \{a\})$, and the result follows.

From these lemmas we immediately infer

1.6. *Theorem.* For any set E , the families of strictly finite, decidable finite, and decidable Kuratowski finite subsets coincide. ■

2. Frege structures from models of Peano's axioms. Let (N, s, θ) be a model of Peano's axioms; we use letters m, n, p as variables ranging over N . We write $<$ for the usual (constructively definable) strict order relation on N (see, e.g., Prop. 7.5 of [2]). Define $g: N \rightarrow PN$ by $g(n) = \{m: m < n\}$; then g satisfies (and in fact can be defined by) the equations

$$g(0) = \emptyset \quad g(sn) = g(n) \cup \{n\}.$$

In order to prove the next Lemma we require the following fact, which is proved constructively as Lemma 3 of [1]:

(*) for any sets X, Y , and any x, y such that $x \notin X, y \notin Y$, if $X \cup \{x\} \approx Y \cup \{y\}$, then $X \approx Y$.

2.1. *Lemma.* For all m, n , $g(m) \approx g(n) \Leftrightarrow m = n$.

Proof. Write $\Phi(n)$ for $\forall m[g(m) \approx g(n) \Leftrightarrow m = n]$. Then clearly $\Phi(0)$. If $\Phi(n)$ and $g(m) \approx g(sn) = g(n) \cup \{n\}$, then $m \neq 0$ so that $m = sp$ for some p . Hence

$$g(p) \cup \{p\} = g(sp) = g(m) \approx g(sn) = g(n) \cup \{n\}.$$

Since $p \notin g(p)$ and $n \notin g(n)$, (*) above implies that $g(p) \approx g(n)$, so, since $\Phi(n)$, $p = n$ and $m = sp = sn$. Hence $\Phi(sp)$, and the result follows by induction.

Now suppose that E is a set such that $N \subseteq E$. Define

$$v = \{(X, n) \in PE \times N : X \approx g(n)\}.$$

2.2. *Lemma.* $\text{dom}(v)$ is the family of strictly finite subsets of E .

Proof. We need to show that $\text{dom}(v)$ is the least inductive family. First, $\text{dom}(v)$ is inductive. For it clearly contains \emptyset and, if $X \in \text{dom}(v)$, then $X \approx g(n)$ for some n . If $x \notin X$, then $X \cup \{x\} \approx g(n) \cup \{n\} = g(sn)$, whence $X \cup \{x\} \in \text{dom}(v)$. And $\text{dom}(v)$ is the least inductive family. For suppose that \mathcal{F} is any inductive family. For each n let $\mathcal{H}_n = \{X : X \approx g(n)\}$. We claim that $\mathcal{H}_n \subseteq \mathcal{F}$ for all n . For obviously $\mathcal{H}_0 = \{\emptyset\} \subseteq \mathcal{F}$. Now suppose that $\mathcal{H}_n \subseteq \mathcal{F}$. If $X \approx g(sn)$, then $X \approx g(n) \cup \{n\}$, so for some $x \in X$ (which may be taken to be the image of n under the bijection $g(n) \cup \{n\} \approx X$), we have $X - \{x\} \approx g(n)$. It follows that $X - \{x\} \in \mathcal{H}_n \subseteq \mathcal{F}$, and so $X = (X - \{x\}) \cup \{x\} \in \mathcal{F}$. The claim now follows by induction; accordingly $\text{dom}(v)$, as the union of all the \mathcal{H}_n , is included in \mathcal{F} . Therefore $\text{dom}(v)$ is the least inductive family and the Lemma is proved.

2.3. *Lemma.* v is a function and $X \approx g(v(X))$ for all $X \in \text{dom}(v)$.

Proof. Suppose that $(X, n) \in v$ and $(X, m) \in v$. Then $X \approx g(n)$ and $X \approx g(m)$ whence $g(m) \approx g(n)$ and so $m = n$ by Lemma 2.1. The remaining claim is obvious.

2.4. *Lemma.* For all $X, Y \in \text{dom}(v)$, $X \approx Y \Leftrightarrow v(X) = v(Y)$.

Proof. We have, using the previous Lemma, $v(X) = v(Y) \Leftrightarrow g(v(X)) \approx g(v(Y)) \Leftrightarrow X \approx Y$.

Lemmas 2.2 - 2.4 establish

2.5. *Theorem.* (E, v) is a minimal Frege structure. ■

(E, v) is called the minimal Frege structure *associated* with E and (N, s, θ) .

Finally, we show that the processes of deriving models of Peano's axioms from minimal Frege structures and *vice-versa* are mutually inverse.

Suppose that we are given a minimal Frege structure (E, μ) . As shown in [1], the associated model (N, s, θ) of Peano's axioms is obtained in the following way. First, the family \mathbb{N} is defined as the least subfamily of $\text{dom}(\mu)$ containing \emptyset and such that, if $X \in \mathbb{N}$ and $\mu(X) \notin X$, then $X \cup \{\mu(X)\} \in \mathbb{N}$: it is shown that $\mu(X) \notin X$ for all $X \in \mathbb{N}$. The associated model (N, s, θ) of Peano's axioms is then defined by $N = \{\mu(X) : X \in \mathbb{N}\}$, $s(\mu(X)) = \mu(X \cup \mu(X))$, and $\theta = \mu(\emptyset)$.

We observe that since (E, μ) is minimal, for any $X \in \text{dom}(\mu)$ there is a (unique) $X^* \in \mathbb{N}$ for which $X \approx X^*$, and so $\mu(X) = \mu(X^*)$. To prove this, it suffices to show that the set of $X \in \text{dom}(\mu)$ with this property contains \emptyset and is closed under unions with disjoint singletons. The first claim is obvious. If $X \in \text{dom}(\mu)$, $x \notin X$, and $X \approx X^*$ with $X^* \in \mathbb{N}$, then

$$X \cup \{x\} \approx X^* \cup \{\mu(X^*)\} \in \mathbb{N},$$

since, as observed above, $\mu(X^*) \notin X^*$. This establishes the second claim, and the observation.

Now let (E, v) be the minimal Frege structure associated with the model (N, s, θ) of Peano's axioms in turn associated with (E, μ) . We claim that $\mu = v$. To prove this it suffices to show that

$$(**) \quad X \approx g(\mu(X)) \text{ for all } X \in \mathbb{N},$$

where \mathbb{N} is defined as above. For then, by Lemma 2.3, we will have $g(v(X)) \approx X \approx g(\mu(X))$ and so $\mu(X) = v(X)$ by Lemma 2.1. This last equality for all $X \in \mathbb{N}$ in turn yields $\mu(Y) = v(Y)$ for all $Y \in \text{dom}(\mu) = \text{dom}(v)$. For then, by our observation above, $\mu(Y) = \mu(Y^*) = v(Y^*) = v(Y)$.

So it only remains to prove (**). It is clearly satisfied by \emptyset . If $X \approx g(\mu(X))$ with $X \in \mathbb{N}$, then, since $\mu(X) \notin X$,

$$X \cup \{\mu(X)\} \approx g(\mu(X)) \cup \{\mu(X)\} = g(s\mu(X)).$$

(**) now follows from the definition of \mathbb{N} . So our claim that $\mu = \nu$ is established.

Conversely, suppose we are given a set E and a model $(N, s, 0)$ of Peano's axioms with $N \subseteq E$. Let (E, ν) be the associated minimal Frege structure. We note first that, for any $n \in N$, we have $\nu(g(n)) = n$, where, as before, $g(n) = \{m: m < n\}$. For by Lemma 2.3, $g(n) \approx g(\nu(g(n)))$, so that, by Lemma 2.1., $n = g(\nu(n))$. Now let $(N^*, s^*, 0^*)$ be the model of Peano's axioms associated with the Frege structure (E, ν) . We claim that $(N, s, 0)$ and $(N^*, s^*, 0^*)$ are identical.

First, $N^* = \{\nu(X): X \in \mathbb{N}^*\}$, where \mathbb{N}^* is the least subfamily of $\text{dom}(\nu)$ containing \emptyset and such that $X \in \mathbb{N}^*$ and $\nu(X) \notin X$ implies $X \cup \{\nu(X)\} \in \mathbb{N}^*$. Using the fact that $\nu(g(n)) = n$ for all $n \in N$, it is easily shown that $\mathbb{N}^* = \{g(n): n \in N\}$. Thus $N^* = \{\nu(X): X \in \mathbb{N}^*\} = \{\nu(g(n)): n \in N\} = \{n: n \in N\} = N$. Finally $0^* = \nu(0) = \nu(g(0)) = 0$ and

$$s^*(n) = s^*(\nu(g(n))) = \nu(g(n) \cup \{\nu(g(n))\}) = \nu(g(n) \cup \{n\}) = \nu(g(sn)) = sn,$$

so that $s^* = s$.

Thus we have established that the two processes are mutually inverse.
